

## **11.0 Screening Conclusion**

The environmental study involved undertaking an inventory of physical, natural and socio-economic features within the study area. This information was used to produce maps identifying features/areas that could be sensitive to roadway construction.

Mitigation measures were prescribed to ensure negative impacts to the environment are minimized. These recommendations should effectively serve to protect environmental features along the proposed roadway. The mitigation recommendations contained in this screening should be included in the contract specifications. Use of a qualified Environmental Inspector will ensure minimal disturbance to the local environment during roadway construction activities.

The project will include incorporation of an Interim and Final Post Construction monitoring report and environmental inspection program.

### **CEEA Determination**

Overall, the project, taking into account mitigation measures, is unlikely to result in significant adverse environmental effects.
